

ABSTRACT

1
2 An electric hairdressing device has several hair
3 curlers with a heat store, a container for storing and
4 heating the hair curlers and a heating device in the
5 storing container with at least one heating element to heat
6 the hair curlers. Each of the hair curlers has a heat store
7 with a heating element receptacle to detachably place a hair
8 curler onto a heating element with one end section freely
9 accessible. The hairdressing device has an application
10 handle for grasping and wrapping the hair curlers in a
11 torsion-tight configuration. The application handle has a
12 pivotably articulated hair curler finger to hold a strand of
13 hair between the hair curler finger and the surface of a
14 hair curler. The hair curler is almost entirely made up of a
15 heat store body and has a smooth surface at least in the
16 section that comes into contact with the hair to be shaped.
